

OpenGL on Android

Lecture 8

Android Native Development Kit

8 April 2014

OpenGL ES

OpenGL ES on Android

Demo

Debugging and Profiling

OpenGL ES

OpenGL ES on Android

Demo

Debugging and Profiling

- ▶ Cut down version of OpenGL
- ▶ Fixed point support
- ▶ Found in many mobile platforms (Android, iOS, Blackberry, Symbian, 3DS, etc.)
- ▶ Designed for slower GPUs and CPUs

- ▶ OpenGL ES 1.0 based on OpenGL 1.3 and OpenGL ES 1.1 based on OpenGL 1.5
- ▶ Common and Common-Lite (only fixed point) profile
- ▶ Fixed-function rendering pipeline
- ▶ Reduced features: no quad and polygon primitives, no stippling, only multisample AA, reduced drawing modes, no display lists, etc.
- ▶ OpenGL ES 1.1 adds better multitexture support, VBOs, clip planes, mipmap generation
- ▶ Android 1.0 and higher

- ▶ Based on OpenGL 2.0, but reduced fixed-function pipeline support
- ▶ Not compatible with OpenGL ES 1.x
- ▶ OpenGL ES Shading Language
- ▶ ESSL only has forward branches and fixed iteration loops
- ▶ Transforming and Lighting functions replaced by shaders
- ▶ Better performance than OpenGL ES 1.x in many cases
- ▶ Android 2.2 and higher

- ▶ Compatible with OpenGL ES 2.0 and OpenGL 4.3
- ▶ Standardized texture compression
- ▶ Better texturing support
- ▶ New Shading Language version with full support for integer and floating point
- ▶ Improved flow control
- ▶ Easier portability
- ▶ Android 4.3 and higher

OpenGL ES

OpenGL ES on Android

Demo

Debugging and Profiling

- ▶ Manages a surface (a piece of memory which can be displayed on screen)
- ▶ Manages an EGL display (an OpenGL rendering context)
- ▶ Dedicated rendering thread
- ▶ Can provide debug information

- ▶ Virtual display which contains a rendering context
- ▶ 2D and 3D rendering
- ▶ Allows having multiple smaller surfaces on the actual screen or drawing to offscreen buffer
- ▶ Used by SurfaceFlinger and other compositors (Wayland, Mir) or libraries (SDL)

OpenGL ES

OpenGL ES on Android

Demo

Debugging and Profiling

OpenGL ES

OpenGL ES on Android

Demo

Debugging and Profiling

- ▶ Logging
- ▶ Debugging Developer Options: Overdraw, Clipping
- ▶ Profiling Developer Options: Performance metrics on screen or through ADB, Traces
- ▶ Tracer for OpenGL ES: Visualize traces

- ▶ Intel Atom processors
- ▶ More information: GPU, CPU, Battery usage
- ▶ More detailed analysis
- ▶ Identifies possible bottlenecks
- ▶ Realtime
- ▶ Works over Wifi

- ▶ Low level information
- ▶ Different interface and capabilities for each vendor
- ▶ Optimizations not always portable
- ▶ PowerVR, Tegra, Adreno, etc
